

FILL KNOWLEDGE GAPS FUNCTIONALITY

The Knowledge Gaps functionality is part of the Content Generation program. It is used to identify what knowledge is necessary to be added to a selected RAG Collection in order to create accurate and informed articles.

From “My Articles” screen, the the user is able click ‘Knowledge Gaps’.

The user will be able to select an existing collection from the dropdown list or add a new collection name.

name

new name

Add

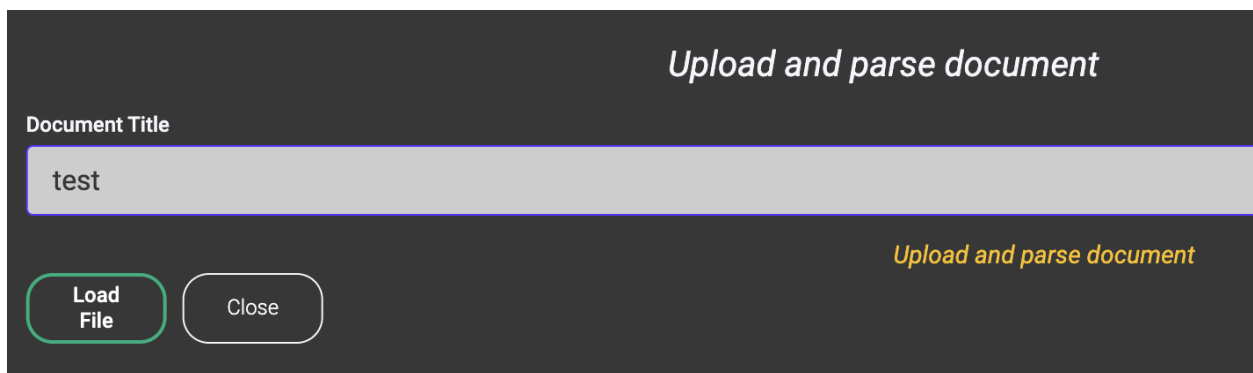

Delete

Close

With a collection selected, all existing document titles already uploaded to that collection are displayed in a table (query from table `lindex_documents` - see technical details).

The user can:

- A) Upload a new file: The user selects a file that is loaded using the backend's llama Cloud's parsing capability.

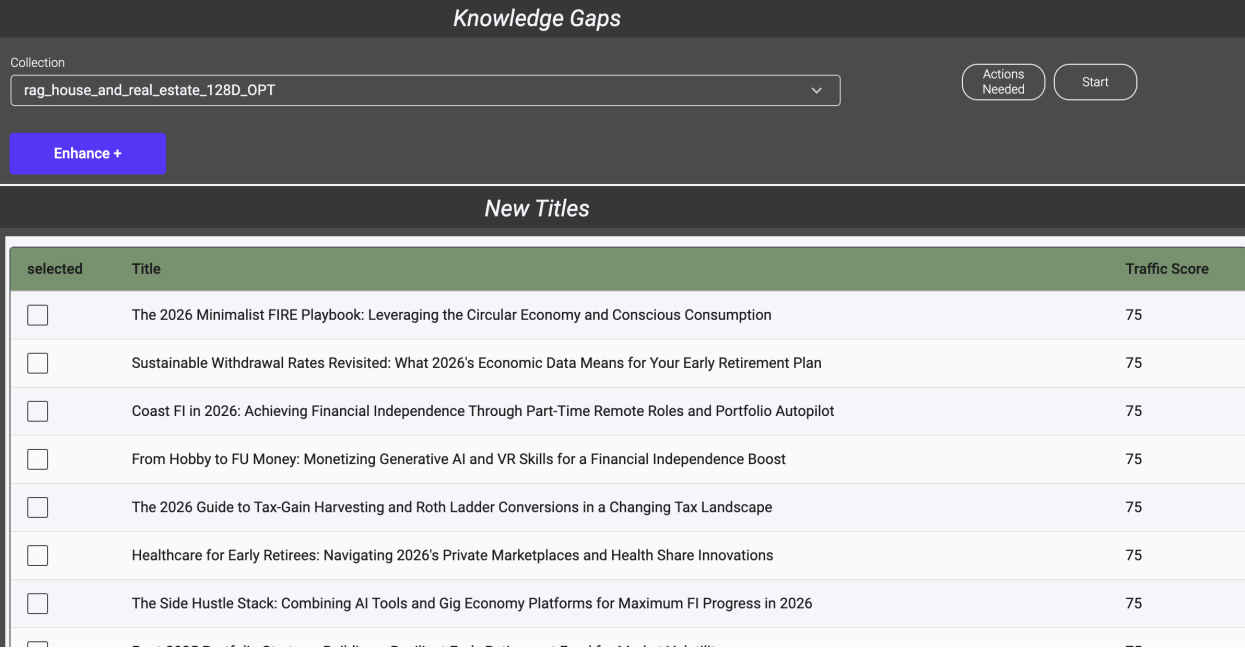

The screenshot shows a dark-themed dialog box titled "Upload and parse document". Inside, there is a label "Document Title" above a text input field containing the word "test". Below the input field, there are two buttons: "Load File" (highlighted with a green border) and "Close". In the bottom right corner, there is a yellow text label "Upload and parse document".

- B) Manual load: The user manually copies and pastes text:

The screenshot shows a dark-themed dialog box titled "RAG Text input". It contains two sections: "Title" with a text input field labeled "Type here", and "Content" with a large text area labeled "Paste text here". A "Close" button is located in the bottom right corner.

- C) GAP Filler: The user can select multiple titles from a list of article ideas (Titles) in status "NEW"

- When the button ‘Start” is clicked the system (backend) will do both, search for knowledge in the web and for the knowledge not found it will suggest further investigation by reading books, getting statistical data or any additional information as manual actions.
- When the user clicks button ‘Actions Needed’ a list of Manual actions already generated by the backend are displayed:

Technical Details

For the technical details I will reference Java Script code that I used in my Noodl prototype

A) Select existing collections:

```
let { data, error } = await Noodl.Variables.supabase
  .from('lindex_collections')
  .select("name, id") // Pass column names as a single string
  .eq('user_id', userID);
```

B) Add new collection:

```
const { data, error } = await Noodl.Variables.supabase
  .from('lindex_collections')
  .insert([
    { name: collectionName, user_id:userID},
  ])
  .select()
```

C) Table with documents inside a collection

```
let { data, error } = await Noodl.Variables.supabase
  .from('lindex_documents')
  .select("*") // Pass column names as a single string
  .eq('user_id', userID)
  .eq('collectionId',collectionId)
  .order('source_type', { ascending: true });
```

D) Upload and parse a file to a collection:

See file "1 Noodl_upload_file-and_parse.txt"

E) Table with Titles in status New:

```
let { data: Title, error } = await Noodl.Variables.supabase
  .from('Titles')
  .select("selected, Title, traffic_potential_score")
  // Filters
  .eq('user_id', userID)
  // --- CORRECTED FILTER HERE ---
  // .or('knowledge_gaps_closed.eq.false,knowledge_gaps_closed.is
  .null')
  // -----
  .in('status', ['New', 'NEW'])
```

```
.order('dateCreatedOn', { ascending: false });
```

F) Manual paste text to Collection: see file “2
Noodl_manual_paste_to_collection.txt”

G) CLOSE GAPS (Start Action)

- Identify titles whose gaps has not been closed: See file “3
Noodl_list_NEW_titles_with_gaps_not_closed.txt”
- Close the gaps: See file “4 Noodl_Fill_gaps.txt”

H) Table with manual actions:

```
// Fetch data from the 'documents' table
let { data, error } = await Noodl.Variables.supabase
  .from('manual_action_suggestions')
  .select("title, description, status") // Pass column names as
a single string
  .eq('user_id', userID)
```
